Systematical Characterization and Experimental Investigation
of Sensory Terms Regarding Oils and Fats
- Focusing on "Oiliness" -

Fumiyo Hayakawa

ABSTRACT

Oils and fats play an important role both in our food preference and in our healthful dietary life. Recently, more and more high-preference foods have been demanded, and less and less oil take-in control has been required. It is necessary to grasp the terms regarding oils and fats objectively. This paper groped for a methodology with trial and error. Through investigation, experiments and analyses, the following results were gained.

A large number of terms in relation to oils and fats were collected using questionnaire by a 30-member laboratory panel. Then 26 terms, such as "*beto-beto-shita*" (viscous, sticky) and "*aburakko*" (oily), were selected as sense-descriptive terms regarding oils and fats by reference to literatures and through table discussion by a 5-member expert panel. These terms were examined by calculating the lipid contents of foods in association with them.

"Oily" and "greasy" were found to be particular terms which relate with several food properties, such as appearance, taste and texture, while the other terms correspond with a single property.

In this paper, "oily" and "greasy" were unified into one word "oily" based on the survey of the kind of oils and fats contained in the foods linked with each term and on the sensory evaluation for fat-in-oil dispersed systems with 0-16 w/w% palm fat.

The association of oiliness with various kinds of foods was studied. The intensity of oiliness for 90 foods was evaluated according to 4-grade system by consumer panel of 1500 subjects. The data were analyzed through Quantification Method III, and the values of 4 categories for each item were obtained. The certain order was

seen among categories in the data. This shows that there is a common concept for "oiliness". The concept is substantially independent of such attributes as sex, age and health consciousness of the subjects. The order was also found among items, which indicates that scaling of "oiliness" is possible, and the intensity of "oiliness" of various kinds of foods were obtained quantitatively.

Using 22 actual foods selected from these 90 foods, a formulation of oiliness was attempted. A sensory test was done by a 12-member trained panel. The hardness, total and surface lipid contents and water content for each food were estimated. However, no proper formula could be found.

Thus, oil-in-water emulsions consisting of corn oil, distilled water, egg yolk and a thickening agent were used as a food model to investigate the relationship between oiliness and physical properties of food. The minimum oil volume fraction which over 65% of the trained tasters judged to be oily was 0.35. A sensory test on emulsions of various composition prepared with different mixing ratios was done, and the particle-size distribution and viscosity were measured. The results of a multiple regression analysis indicate that the intensity of oiliness depend on viscosity, which can be expressed in the form of a single regression equation:

$$Y = -1.246 + 0.695X \quad (Y, \text{ oiliness; } X, \ln \text{ of apparent viscosity at a shear rate of } 50\text{s}^{-1}).$$

With an increase of acetic acid in emulsions, the intensity of oiliness decreased significantly, while oiliness was independent of such gustatory substance (sucrose, sodium chloride and mono sodium glutamate), spice (mustard, pepper and ginger) and rancid flavor.

This paper has objectified the sensory terms regarding oils and fats, which has never been done in spite of the urgent requirement in various fields. The scaling and formulation of oiliness obtained in this paper, though they are not perfect, will present useful information to the field of food science and food engineering. In addition, it has proposed a methodology, which might contribute itself to the development of a field of food culture research.

目次

第1章 序論	
1.1 はじめに	… 1
1.2 油脂の関与する感覚用語	… 3
1.3 本研究の目的と意義	… 5
1.4 本研究の概要	… 6
第2章 油脂の関与する感覚用語の収集および特徴づけ	
2.1 はじめに	… 8
2.2 方法	… 9
2.2.1 用語の収集	… 9
2.2.2 料理名の収集と油脂含量の算定	… 9
2.2.3 食味要因との関係についての評価	… 15
2.3 結果および考察	… 17
2.3.1 油脂の関与する用語の種類	… 17
2.3.2 用語の特徴（その1） — 対応する料理の油脂含量から —	… 20
2.3.3 用語の特徴（その2） — 対応する食味要因との関係から —	… 30
2.4 まとめ	… 37
第3章 “油っこい”と“脂っこい”の整理・統一	
3.1 はじめに	… 38
3.2 方法	… 38
3.2.1 料理に用いる油脂の種類調査	… 38
3.2.2 実験	… 38
3.3 結果および考察	… 43
3.3.1 “油っこい”と“脂っこい”の特徴 — 料理に用いられる油脂の種類から —	… 43
3.3.2 あぶらっこさと固形脂含量	… 46
3.4 まとめ	… 49

第4章	意識調査によるあぶらっこさの尺度化	
4.1	はじめに	… 50
4.2	方法	… 51
4.2.1	調査対象および標本抽出	… 51
4.2.2	調査した食物の選定	… 51
4.2.3	調査票の作成	… 51
4.2.4	調査の実施	… 53
4.2.5	集計および解析	… 53
4.3	結果および考察	… 55
4.3.1	回収率およびパネルの属性	… 55
4.3.2	単純集計によるデータの概要把握	… 55
4.3.3	あぶらっこさの概念の共通性の証明	… 61
4.3.4	あぶらっこさの尺度化	… 69
4.4	まとめ	… 74
第5章	客観的パラメータによるあぶらっこさの数式化の試み	
5.1	はじめに	… 78
5.2	方法	… 79
5.2.1	試料	… 79
5.2.2	理化学的測定	… 79
5.2.3	官能検査	… 86
5.2.4	統計処理	… 88
